Apply Concierge — One-Click Apply with personal intelligence

Opportunity still arrives as a PDF

Scholarships. Competitions. Housing. Government programs.
Permits. Job postings. Forms nobody reads twice.

Before you can apply, you answer these alone

- Am I eligible?
- What documents do I need?
- Which forms do I have to fill out?
- When and where do I submit?
- Are there exceptions or hidden requirements?

Every answer is buried somewhere in the notice.

Miss one requirement, lose the whole opportunity

There is no partial credit in an application.

What we built

A universal interface for anything that can be submitted

Hand it the document. Ask three questions.

Can I apply?

What do I need?

Can you submit it for me?

No parsing PDFs. No cross-checking forms.

No learning one more government website.

One path, end to end

Document → Eligibility → Requirements → Preparation → Submission

Stage	What happens
Document	A file, a link, or a sentence — we take any of them
Eligibility	Requirements are extracted and matched against you
Requirements	Missing items become a short list of questions
Preparation	Forms are filled, documents are drafted
Submission	The browser applies, with your authorization

Reading the document

Upstage Studio

The notice is not one kind of document

A workflow classifies what it is, then branches — a grant notice, a housing application, and a job posting need different questions asked.

- **Parse** — PDF, HWP, DOCX, XLSX, scans
- **Classify** — route to the right extractor
- **Extract** — eligibility, deadlines, required documents, form fields
- **Instruct** — what is still missing from this applicant

The workflow lives in our repository as code, not as clicks in a UI.
Every change is reviewable, and every version is kept.

Every value points back to the page

Extraction returns coordinates, so an answer can show its source — the exact block of the original notice it came from.

And when we cannot find it, we say so.

An unfounded highlight is decoration pretending to be evidence.

Trust is the product.

Personal intelligence

Answer once. Never again.

The second application is easier than the first

What you type into one application is remembered and reused in the next — even when the next one asks for it by a different name.

"Number of full-time employees" finds what you saved as "current headcount."

The knowledge base is curated by an agent, not edited by hand.
You say what changed; it decides what to update.

Preparation — and what we refuse to do

- Official templates the notice provides are **filled**, not replaced — agencies reject documents that are not on their own form
- Narrative documents are drafted from what we know about you
- **Issued certificates are never generated.** Producing one is forgery. We retrieve it from your vault, or we ask you for it

Submission — and knowing when to stop

We check for a CAPTCHA before starting, and that decides everything.

	No CAPTCHA	CAPTCHA present
How	Reads the page structure directly	Real screen, real cursor
Speed	Fast and precise	Slower
Who solves it	The agent	You do

The screen is live the whole time. When something needs a human — a CAPTCHA, an identity check — control is handed over, then work resumes.
